

1 ABSTRACT OF THE DISCLOSURE

2 A fluid handling device having a support frame and a plurality of filter frames  
3 attached thereto. Each of the filter frames has an outer frame member that removably  
4 secures a filter; the filters being either a planar filter, pocket filter, or multiple pocket  
5 filter. The various filters can be arranged to correlate the change-out schedule of all of  
6 the filters across the fluid flow area. The filters with the highest particulate capacity  
7 can be arranged to be in the zone of the fluid flow area with the highest particulate  
8 concentration. The filters are easily constructed from a single piece of filtration media  
9 and collapsible to save space when storing or shipping.
